(54) Title: METHOD, SYSTEM AND COMPUTER PROGRAM PRODUCT FOR TRANSMITTING A MEDIA STREAM BETWEEN CLIENT TERMINALS
(57) Abstract: The present invention relates to a method and system for transmitting a media stream of data from a sending client terminal (10) to a receiving client terminal (20), the terminals being arranged in a protected computer environment including at least one protective means (30) in association with a data forwarding means (40). The protective means is intended to protect the receiving client terminal from data transmitted from unauthorised sending clients. The method comprises the steps of: transmitting authorisation data from the receiving client terminal to sending client terminal via the protective means for instructing the means to allow return of a me-dia stream from the sending client terminal to the receiving client terminal during a predetermined period of time. Moreover, the method is characterised by the step of: the receiving client terminal is adapted to independently transmit authorisation data via the protective means at shorter intervals than said predetermined period of time for maintaining the allow return mode of the protective means.
